ATLAS AND PRINCIPLES

L. HALLMANN: BAKTERIOLOGIE UND SEROLOGIE 2. AUFL.

Druckfehlerberichtigungen und Ergänzungen

Seite 87, Abschn. (7): Verwende zur Phosphatasebestimmung besser das haltbarere Colaminphenolphthaleinphosphat (Merck) anstatt Natriumphenolphthaleinphosphat.

Seite 227, 4. Abschn., 5. Zeile: *Bac. necrophorus* (anstatt *necrophores*).

Seite 229, 9. Zeile von unten: *Herellea vaginicola* (anstatt *Hellerea*).

Seite 232, 10. Zeile von unten: *Butyribacterium* (anstatt *Butyrobacterium*).

Seite 236, 17. Zeile von unten: *Lactobac. wehmeri* (anstatt *weheri*).

Seite 236, 2./3. Zeile von unten: *Acetobacter pasteurianum* (anstatt *pasteurianus*).

Seite 238, 19. Zeile von oben: *lactis innocuus* (anstatt *innocens*).

Seite 336, 22./23. Zeile von oben: *Bac. innutritus* (anstatt *innutricus*).

Seite 515, 10. Zeile von oben: BHATNAGAR (anstatt Bathnagar).

Seite 517, 1. Zeile von oben: BHATNAGAR (Eigenname! anstatt Bhatnagar).

ATLAS AND PRINCIPLES
OF
BACTERIOLOGY

AND TEXT-BOOK OF
SPECIAL BACTERIOLOGIC DIAGNOSIS

BY
PROF. DR. K. B. LEHMANN
Director of the Hygienic Institute in Würzburg
AND
R. O. NEUMANN, DR. PHIL. and MED.
Assistant in the Hygienic Institute in Würzburg

AUTHORIZED TRANSLATION FROM THE SECOND
ENLARGED AND REVISED GERMAN EDITION

EDITED BY
GEORGE H. WEAVER, M.D.
Assistant Professor of Pathology, Rush Medical College, Chicago

PART I—ATLAS
With 632 Figures on 69 Lithographic Plates

INDEX OF PLATES.

PLATE.

1. *Streptococcus pyogenes*. Rosenbach.
2. *Streptococcus lanceolatus*. Gamaleia. (*Diplococcus pneumoniae*. A. Fränkel.)
3. *Sarcina flava*. De Bary, emended by Lehm. and Stubenrath.
4. *Sarcina aurantiaca*. Flügge.
5. *Sarcina cervina*. Stubenrath.
Sarcina pulmonum. Virchow.
Sarcina erythromyxa. Král.
Sarcina lutea. Flügge.
Sarcina aurantiaca. Flügge.
Sarcina rosea. Schröter, emended by Zimmermann.
Micrococcus badius. Lehm. and Neum.
Sarcina canescens. Stubenrath.
6. *Micrococcus luteus*. Cohn, emended by Lehm. and Neum.
Sarcina pulmonum. Virchow, Hauser.
7. *Micrococcus tetragenus*. Koch, Gaffky.
8. *Micrococcus pyogenes* α aureus. (Ros.) Lehm. and Neum.
(*Staphylococcus pyogenes aureus*. Rosenbach.)
9. *Micrococcus pyogenes* γ albus. (Ros.) L. and N. (*Staphylococcus pyogenes albus*. Rosenbach).
Micrococcus pyogenes β citreus. (Ros.) (*Staphylococcus pyogenes citreus*. Rosenbach.)
Micrococcus candicans. Flügge.
10. *Micrococcus gonorrhoeae*. Neisser, Bumm.
11. *Micrococcus roseus*. (Bumm.) Lehm. and Neum.
12. *Bacterium septicaemiae haemorrhagicae*. Hüppe. (Chicken cholera, rabbit septicemia.)
13. *Bacterium pestis*. Lehm. and Neum.
14. *Bacterium acidi lactici*. Hüppe. (Lactic acid bacillus.)
15. *Bacterium pneumoniae*. Friedländer.
16. *Bacterium typhi*. Eberth, Gaffky. (Typhoid bacillus.)
17. *Bacterium typhi*. Eberth, Gaffky.
18. *Bacterium coli*. (Escherich.) Lehm. and Neum.
19. *Bacterium coli*. (Escherich.) Lehm. and Neum.
20. *Bacterium latericum*. Adametz.
Bacterium haemorrhagicum. (Kolb.) Lehm. and Neum.
(Morb. Werlhofii.)
21. *Bacterium prodigiosum*. (Ehrenberg.) Lehm. and Neum.

PLATE.

22. *Bacterium kiliense*. (Breunig and Fischer.) Lehm. and Neum.
23. *Bacterium violaceum*. (J. Schröter.) Lehm. and Neum.
24. *Bacterium pyocyaneum*. (Flügge.) Lehm. and Neum. (Green pus.)
25. *Bacterium fluorescens*. (Flügge.) Lehm. and Neum. (*Bacillus fluorescens liquefaciens*, Flügge.)
26. *Bacterium putidum*. (Flügge.) Lehm. and Neum.
27. *Bacterium syncyaneum*. (Ehrenberg.) Lehm. and Neum. (*Bacillus cyanogenes* Flügge. Blue milk.)
28. *Bacterium syncyaneum*. (Ehrenberg.) Lehm. and Neum.
29. *Bacterium Zopfii*. Kurth.
30. *Bacterium Zopfii*. Kurth.
31. *Bacterium vulgare*. (Hauser.) Lehm. and Neum. (*Proteus vulgaris* Hauser.)
32. *Bacterium vulgare* β *mirabilis*. (Hauser.) Lehm. and Neum.
33. *Bacterium erysipelas*. (Löffler.) Migula. (Hog erysipelas.)
Bacterium murisepticum. (Flügge.) Migula. (Mouse septiciemia.)
34. *Bacillus anthracis*. F. Cohn and R. Koch. (Splenic fever.)
35. *Bacillus anthracis*. F. Cohn and R. Koch. (Splenic fever.)
36. *Bacillus anthracis*. F. Cohn and R. Koch. (Splenic fever.)
37. *Bacillus mycoides*. Flügge. (Root-bacillus.)
38. *Bacillus mycoides*. Flügge.
Bacillus butyricus. Hüppe. (Butyric acid bacillus.)
Bacillus vulgatus. (Flügge.) Migula.
39. *Bacillus subtilis*. F. Cohn. (Hay-bacillus.)
40. *Bacillus subtilis*. F. Cohn.
41. *Bacillus megatherium*. De Bary.
42. *Bacillus vulgatus*. (Flügge.) Migula. (*B. mesentericus vulgatus* Flügge.) Potato bacillus.
43. *Bacillus mesentericus*. (Flügge.) Lehm. and Neum. (*B. mesentericus fuscus* Flügge.)
44. *Bacillus tetani*. Nicolaier. (Tetanus bacillus, lock-jaw.)
45. *Bacillus Chauvœi*. Macè. (Symptomatic anthrax, black-leg.)
46. *Bacillus edematis maligni*. Koch.
47. *Vibrio cholerae*. (Koch.) Buchner. (Comma bacillus.)
48. *Vibrio cholerae*. (Koch.) Buchner.
49. *Vibrio cholerae*. (Koch.) Buchner.
50. *Vibrio cholerae*. (Koch.) Buchner.
51. *Vibrio cholerae*. (Koch.) Buchner.
Vibrio Metschnikovii. Gamaleia.
52. *Vibrio Proteus*. Buchner. (*Vibrio Finkler*.)
53. *Vibrio danubicus*. Heider.
Vibrio berolinensis. Rubner.
Vibrio aquatilis. Günther.
54. *Vibrio albensis*. Lehm. and Neum. (Phosphorescent Elbe Vibrio.)
55. *Spirillum rubrum*. v. Esmarch.

PLATE.

- Spirillum concentricum. Kitasato.
 56. Spirillum serpens. (E. O. Müller.) Zettnow.
 Spirilla from nasal mucus.
 Spirillum undula. Ehrenberg.
 Spirillum spermatozoides. Löffler.
 Spirochæte of oral mucus.
 Spirillum Obermeieri. F. Cohn. (Spirilla of recurrent fever.)
 57. Corynebacterium mallei. (Löffler.) Lehm. and Neum. (Glanders bacillus.)
 58. Corynebacterium diphtheriæ. (Löffler.) Lehm. and Neum. (Diphtheria bacillus.)
 Corynebacterium pseudodiphtheriticum. (Hoffmann-Wellenhof.) Lehm. and Neum. (Pseudodiphtheria bacillus.)
 Corynebacterium xerosis. (Kuschbert, Neisser.) Lehm. and Neum. (Xerosis bacillus.)
 59. Corynebacterium diphtheriæ. L. and N.
 Corynebacterium pseudodiphtheriticum. L. and N.
 Corynebacterium xerosis. L. and N.
 60. Corynebacterium diphtheriæ. L. and N.
 Corynebacterium pseudodiphtheriticum. L. and N.
 Corynebacterium xerosis. L. and N.
 61. Mycobacterium tuberculosis. (Koch.) L. and N. (Tubercle bacillus.)
 62. Mycobacterium lepræ. (Arm. Hansen.) L. and N. (Lepra bacillus.)
 Mycobacterium tuberculosis ; piscicola. L. and N.
 63. Mycobacterium lacticola β perrugosum. L. and N.
 Mycobacterium phlei. Lehm. and Neum.
 64. Mycobacterium lacticola α planum. L. and N.
 65. Actinomyces bovis. Harz. (Actinomycosis.)
 66. Actinomyces farcinicus. (Nocard.) Gasperini. (Fracin du bœuf.)
 67. Actinomyces chromogenes. Gasperini. (Cladothrix dichotoma Autorum non Cohn.)
 68. Bacterium tussis convulsivæ. (Czaplewski and Hensel.) (Whooping-cough.)
 Bacterium ulceris canerosi. (Ducrey, Kruse.) L. and N. (Ulcus molle.)
 Streptococcus meningitidis cerebrospinalis (Weichselbaum). Lehm. and Neum.
 Bacterium influenzæ. (R. Pfeiffer.) L. and N. (Influenza bacillus.)
 Bacillus gangrænæ pulpæ. Arkövy.
 69. Leptothrix epidermidis. Biz.

Tab. 1.

PLATE 1.

Streptococcus pyogenes. Rosenbach.

- I. *Agar streak culture*, ten days at 37°.
- II. *Gelatin stab culture*, six days at 22°. So vigorous a growth does not often occur.
- III. *Agar stab culture*, six days at 37°. Stab canal.
- IV. *Agar stab culture*, six days at 37°. Surface growth.
- V. *Gelatin plate*, six days at 22°.
- VI. *Gelatin plate*, six days at 22°. $\times 70$. Somewhat abnormal form with irregular borders. The larger colonies are superficial; the smaller, deep.
- VII. *Gelatin plate*, six days at 22°. $\times 70$. Common form. The upper, superficial; the lower, deep.
- VIII. *Agar plate*, eight days at 37°. $\times 50$. Larger colony superficial; smaller colonies, deep.
- IX. *Microscopic preparation* from a two days' bouillon culture at 37°. $\times 700$. The individual cocci are usually more regularly round.
- X. *Microscopic preparation* from a two days' agar culture. Shorter chains. $\times 1000$.
- XI. *Microscopic preparation*, designated *Streptococcus conglomeratus*. Smear preparation from the blood of the spleen from a case of scarlatina. Copied from Kurth (Kaiserl. Gesundheitsamt., Bd. VII, cfr. xv, 6 and 8).
- XII. *Chains of streptococci*, before and during division. Highly magnified.

XII.

PLATE 2.

Streptococcus lanceolatus. Gamaleia. (Diplococcus pneumoniae A. Fränkel.) (Pneumococcus.)

I. *Gelatin stab culture*, ten days at 22°.

II. *Agar streak culture*, four days at 37°.

III. *Agar stab culture*, four days at 37°. Stab canal.

IV. *Agar stab culture*, four days at 37°. Surface growth.

V. *Agar plate*, three days at 37°. Natural size.

VI. *Agar plate*, three days at 37°. $\times 50$. Superficial colony. The darker colony lies near the surface.

VII. *Agar plate*, three days at 37°. $\times 50$. Deep colonies.

VIII. *Gelatin plate*, eight days at 22°. The upper colony is superficial; the lower ones, deep.

IX. *Smear preparation* from pneumonic sputum. $\times 1000$.

X. *Pure culture* from a three days' old agar plate. $\times 1000$.

XI. *Microscopic preparations*: (a) Diplococci as single pairs and in chains. Highly magnified. (b) Diplococci surrounded by gelatinous capsules.

PLATE 3.

Sarcina flava. De Bary, emended by Lehm. and Stubenrath.

- I. *Gelatin stab culture*, ten days at 22°.
- II. *Agar streak culture*, six days at 22°.
- III. *Agar stab culture*, six days at 22°; stab canal.
- IV. *Agar stab culture*, six days at 22°; surface growth.
- V. *Gelatin plate*, five days at 22°. Natural size.
- VI. *Gelatin plate*, five days at 22°. $\times 60$. Superficial colony.
- VII. *Agar plate*, six days at 22°. Natural size.
- VIII. *Agar plate*, six days at 22°. $\times 60$. Upper colony is superficial, lower ones are deep.
- IX. *Potato culture*, ten days at 22°.
- X. *Microscopic preparation*. Pure culture from an agar plate. $\times 1000$. Stained with fuchsin and differentiated with acetic acid.
- XI. *Microscopic preparation*. Pure culture in bouillon; unstained. $\times 1000$.
- XII. *Sarcinæ forming bales of packets*. (Single packets regularly grouped together.)
- XIII. *Sarcinæ in bunches of packets*. (Single or irregular packets, grouped together irregularly.)

XII.

XIII.

PLATE 4.

Sarcina aurantiaca. Flügge.

I. *Gelatin stab culture*, six days at 22°.

II. *Agar streak culture*, five days at 22°. The color is not so red in all cases; usually light orange. This is also true of the agar stab and potato cultures.

III. *Agar stab culture*, six days at 22°. Stab canal.

IV. *Agar stab culture*, six days at 22°. Surface growth.

V. *Gelatin plate*, five days at 22°. Natural size. The gray zone about the colonies indicates a depression.

VI. *Gelatin plate*, five days at 22°. $\times 60$. A colony in the early stage. The gray ring represents a zone where it is sinking in.

VII. *Agar plate*, five days at 22°. Natural size.

VIII. *Agar plate*, five days at 22°. $\times 60$. Upper colony, superficial; lower colonies, deep. The superficial colonies usually become opaque toward the center.

IX. *Potato culture*, eight days old.

X. *Microscopic preparation*. Pure culture from agar. $\times 1000$. Stained with fuchsin, differentiated with acetic acid.

XI. *Microscopic preparation*. Pure culture in bouillon. $\times 1000$. Unstained, partly schematic.

PLATE 5.

Various Sarcinæ.

I. *Sarcina cervina* Stubenrath. Agar streak culture, fifteen days at 22°, isolated from gastric contents.

II. *Sarcina pulmonum* Virchow. Agar streak culture, fifteen days at 37°.

III. *Sarcina erythromyxa* Král. Agar streak culture, thirty days at 22°, isolated from beer.

IV. *Sarcina lutea* Flügge. Agar streak culture, ten days at 22°, isolated from stomach.

V. *Sarcina aurantiaca* Flügge. Agar streak culture, ten days at 22°, isolated from yeast.

VI. *Sarcina rosea* Schröter, emended by Zimmermann. Agar streak culture, twenty-five days at 22°, isolated from light beer.

VII. *Micrococcus radius* Lehm. and Neum. Agar streak culture, fifteen days at 22°, isolated from air.

VIII. *Sarcina canescens* Stubenrath. Agar streak culture, twenty days at 22°, isolated from the stomach.

PLATE 6.

Micrococcus luteus. Ferd. Cohn, emended by Lehm. and Neum.

I. *Gelatin stab*, six days at 22°.

II. *Gelatin plate*, three days at 22°. $\times 50$. To the left, superficial; to the right, a deep colony.

III. *Microscopic preparation*. $\times 1000$. From a two-days'-old agar plate. Often the micrococci are grouped in tetrads.

IV. *Agar plate*, five days at 22°. Natural size. The colonies are sometimes more yellow.

V. *Potato culture*, six days at 22°. Sometimes it has a dull luster.

Sarcina pulmonum. Virchow. Hausér.
(Pulmonary Sarcina.)

VI. *Gelatin stab*, twenty days at 22°. The stab is in reality more gray.

VII. *Agar streak*, twenty days at 22°.

VIII. *Gelatin plate*, twenty days at 22°. To the left, a superficial; to the right, a deep colony.

IX. *Potato culture*, twenty days at 22°.

X. *Stained flagella*. Highly magnified.

PLATE 7.

Micrococcus tetragenus. Koch. Gaffky.

I. *Agar streak culture*, five days at 37°.

II. *Gelatin stab culture*, ten days at 22°. Stab canal.
Characteristic nail-head form.

III. *Gelatin stab culture*, ten days at 22°; surface growth.
In the reproduction the color has turned out brown, but should be white.

IV. *Agar stab culture*, six days at 37°. Surface growth.

V. *Agar stab culture*, six days at 37°. The growth along the stab is not always so luxuriant.

VI. *Agar plate*, five days at 37°. Natural size.

VII. *Gelatin plate*, eight days at 22°. The colonies are naturally pure white. Natural size.

VIII. *Gelatin plate*, eight days at 22°. $\times 60$. The larger colony is superficial; the smaller, deep.

IX. *Microscopic preparation*. From a two-days'-old agar culture. $\times 800$. There are not always found tetrads alone, often also single cocci.

X. *Potato culture*, seven days at 37°.

XI. *Microscopic picture*. Tetrads before, during, and after division; highly magnified.

XI.

PLATE 8.

Micrococcus pyogenes *a aureus*. (Rosenbach.) Lehm.
and Neum.

(*Staphylococcus aureus* Ros.)

I. *Gelatin stab culture*, six days at 22°.

II. *Agar streak culture*, five days at 22°.

III. *Agar stab culture*, five days at 22°. Stab canal.

IV. *Agar stab culture*, five days at 22°; surface growth.

V. *Agar plate culture*, six days at 22°, natural size.

Superficial and deep colonies.

VI. *Agar plate*, six days at 22°. $\times 60$. Small superficial colony.

VII. *Gelatin plate*, four days at 22°, natural size. Superficial and deep colonies.

VIII. *Gelatin plate*, four days at 22°. $\times 60$. Superficial and deep colonies.

IX. *Potato culture*, six days at 22°.

X. *Microscopic preparation*. $\times 1000$. From an agar culture, two days old, at 22°.

XI. *Microscopic preparation*. Single cocci, before, during, and after division. $\times 1500$.

PLATE 9.

Micrococcus pyogenes γ albus. (Rosenbach.) L. and N.
(*Staphylococcus albus* Rosenbach.)

- I. *Agar streak culture*, four days at 22°.
- II. *Gelatin stab culture*, five days at 22°.

Micrococcus pyogenes β citreus. (Rosenbach.) L. and N.
(*Staphylococcus citreus* Rosenbach.)

- III. *Agar streak culture*, six days at 22°.

Micrococcus candicans. Flügge.

- IV. *Gelatin stab culture*, six days at 22°.
- V. *Gelatin plate*, eight days at 22°.
- VI. *Gelatin plate*, six days at 22°. $\times$ 50. To the left a superficial, to the right a deep colony.
- VII. *Potato culture*, ten days at 22°.
- VIII. *Microscopic preparation* from a two-days'-old culture on agar. $\times$ 700.

PLATE 10.

Micrococcus gonorrhœæ. Neisser. Bumm.

I. *Agar streak culture*, ascites-glycerin-agar, three days at 37°.

II. *Agar plate*, forty-eight hours at 37°. $\times 60$. Superficial colonies. The agar was poured out, and blood from the finger-tip smeared upon it, and upon this was placed the gonorrheal pus. The reddish places are blood. The colonies of the gonococcus grow principally at the periphery of the blood smear.

III. *Serum-agar plate*. The upper colony three days, the lower twenty-four hours, at 37°. $\times 60$. Superficial colonies. One c.c. of human serum was added to the agar.

IV. *Serum-agar plate*. The same colonies after eight days.

V. *Ascites-glycerin-agar plate*, forty-eight hours at 37°. $\times 60$. Superficial colonies of a pure culture from blennorrheal pus. To 5 c.c. of a 2% agar, containing 5% of glycerin, 1.5 c.c. of human ascites-fluid were added.

VI. *Ascites-glycerin-agar plate*, forty-eight hours, at 37°. $\times 60$. Superficial colonies. After pouring out the agar, blennorrheal pus was smeared upon it. The darker septa are pus (pushed together by the growing colonies); also the material at the periphery of the colonies.

VII. *Smear preparation from gonorrheal pus*. $\times 1000$. Stained with methylene-blue.

VIII. *Smear preparation from blennorrheal pus*. $\times 1000$. Stained with methylene-blue. A pus cell in which lie the micrococci, almost always in fours in capsules. The preparation contains a great many micrococci thus situated.

IX. *Smear preparation from blennorrheal pus*. $\times 1000$. Stained with methylene-blue and eosin.

X. *Micrococci*, highly magnified, schematic.

PLATE II.

Micrococcus roseus. (Bumm.) Lehm. and Neum.
(*Diplococcus roseus* Bumm.)

I. *Gelatin stab culture*, twenty days at room temperature.

II. *Agar streak culture*, thirty days at room temperature. The white reflex on the right side is not always so marked.

III. *Agar stab culture*, ten days at 22°. Stab canal.

IV. *Agar stab culture*, ten days at 22°. Surface growth.

V. *Agar plate*, twelve days at 22°. $\times 50$. Above, a superficial; below, a deep colony.

VI. *Agar plate*, fourteen days at 22°. $\times 50$. More delicate structure. Above, a superficial; below, deep colonies.

VII. *Gelatin plate*, eight days at 22°. $\times 50$. Superficial and deep colonies.

IX. *Potato culture*. A culture of the *Diploc. roseus*, grown upon a culture of anthrax; ten days at room temperature.

X. *Potato culture*, twenty days at room temperature.

XIII. *Microscopic preparation*, from three-days'-old agar culture. $\times 1000$. The cocci are undergoing division.

PLATE 12.

Bacterium septicæmiæ hæmorrhagicæ. Hüppe.
(Chicken Cholera, Rabbit Septicemia, etc.)

- I. *Gelatin stab culture*, seven days at 22°.
- II. *Agar streak culture*, seven days at 22°.
- III. *Agar plate*, five days at 22°. Natural size.
- IV. *Agar plate*, five days at 22°. × 60. Superficial colony. Compare also Plate 14, VI; Plate 17, VI; Plate 18, VII.
- V. *Agar plate*, five days at 22°. × 60. Deep colonies.
- VI. *Gelatin plate*, five days at 22°. Natural size.
- VII. *Gelatin plate*, five days at 22°. × 90. Deep colonies.
- VIII. *Gelatin plate*, five days at 22°. × 90. Superficial colony. Compare also Plate 14, VIII; Plate 17, I; Plate 16, VIII; Plate 19, III, IV, VII.
- IX. *Microscopic preparation*. × 1000. Pure culture from agar plate.
- X. *Single bacteria*. Highly magnified. Schematic.

PLATE 13.

Bacterium pestis. Lehm. and Neum.

I. *Streak culture* (ascites-glycerin-agar), three days at 37°.

II. *Streak culture* (agar), forty-eight hours at 37°. (After a culture of Dr. Dieudonné, preserved with formalin.) The streak was made with the juice direct from a bubo. The transparent, dewdrop-like growth is characteristic.

III. *Stab culture* (gelatin), six days at 22°. The growth consists of minute, waxy, markedly elevated colonies, which become confluent; also the same upon the gelatin plate (v, b).

IV. *Plate culture* (gelatin), six days at 22°. $\times 60$. (a) Deep colony; (b) superficial colony.

V. *Plate culture*: (a) Glycerin-agar, three days at 37°. Natural size. Superficial colonies. (b) Gelatin, six days at 22°. Natural size. Superficial colonies. Compare what is said under Fig. III.

VI. *Plate culture* (agar), forty-eight hours at 37°. $\times 60$. Superficial colonies. They correspond to the dewdrop-like colony in the agar streak culture (II). (a) Younger, (b) older colonies.

VII. *Plate cultures*, forty-eight hours at 37°. $\times 60$.

(a) Ordinary agar	}	Superficial colonies.
(b) Glycerin-agar		
(c) Ascites-glycerin-agar		
(d) Ascites-glycerin-agar, deep colony.		

The crumbly character of cultures after being cultivated in contrast to very fresh cultures is to be noted (compare VI).

VIII. *Microscopic preparation*, three days at 37° on glycerin-agar. $\times 1000$. Stained with fuchsin. Involution forms.

IX. *Microscopic preparation*: Smear from the juice of a bubo. $\times 1000$. Stained with methylene-blue. (From a preparation of Dr. Dieudonné.)

X. *Microscopic preparation*: (a) Ordinary agar, twenty-four hours at 37°. $\times 1000$. Stained with fuchsin. (b) Ordinary bouillon, twenty-four hours at 37°. $\times 1000$. Stained with fuchsin.

PLATE 14.

Bacterium acidi lactici. Hüppe. (Lactic Acid Bacillus.)

I. *Gelatin stab culture*, five days at 22°. The stab canal in nature is somewhat whiter.

II. *Agar streak culture*, five days at 22°.

III. *Agar stab culture*, three days at 22°. Stab canal.

IV. *Agar stab culture*, three days at 22°. Surface growth.

V. *Agar plate*, three days at 22°. Natural size.

VI. *Agar plate*, three days at 22°. $\times 50$. Upper colony superficial, lower colonies deep. Compare also Plate 18, VII.

VII. *Gelatin plate*, two days at 22°. Natural size.

VIII. *Gelatin plate*, two days at 22°. $\times 50$. Upper colony superficial, lower colonies deep. The superficial colonies may vary very much. Compare also Plate 16, VIII, IX; Plate 17, I, II; Plate 19, IV, VII.

IX. *Microscopic preparation*. Pure culture from an agar colony. $\times 800$.

X. *Potato culture*, six days at 22°. The air-bubbles on the surface often cover it completely.

PLATE 15.

Bacterium pneumoniae. Friedländer. (Friedländer's
Pneumonia Bacillus.)

- I. *Agar streak culture*, four days at 22°.
- II. *Gelatin stab culture*, ten days at 22°.
- III. *Agar stab culture*, four days at 22°. Stab canal.
- IV. *Agar stab culture*, four days at 22°. Surface growth.
- V. *Gelatin plate*, three days at 22°. Natural size.
- VI. *Agar plate*, two days at 22°. $\times 60$. The brown whetstone-shaped colony is deep.
- VII. *Gelatin plate*, three days at 22°. $\times 50$. Upper, superficial; lower, deep colony.
- VIII. *Agar plate*, four days at 22°. Natural size. The delicate gray colonies are deep; also the smallest colonies. One colony in the reproduction has turned out yellowish.
- IX. *Microscopic preparation*. Pure culture from an agar plate. $\times 800$. Stained with fuchsin.
- X. *Microscopic preparation*. Smear preparation from sputum. $\times 800$. Stained with fuchsin.
- XI. *Potato culture*, six days.

PLATE 16.

Bacterium typhi. Eberth. Gaffky. (Typhoid Bacillus.)

I. *Agar stab culture*, three days at 22°. Stab canal.

II. *Agar stab culture*, three days at 22°. Surface growth.

III. *Gelatin stab culture*, eight days at 22°. Stab canal.

IV. *Gelatin stab culture*, eight days at 22°. Surface growth.

V. *Agar streak culture*, four days at 22°. Compare also Plate 18, III.

VI. *Gelatin streak culture*, three days at 22°. Compare also Plate 18, II.

VII. *Gelatin plate*, thirty-six hours at 22°. Deep colony. Compare also Plate 14, VIII; Plate 19, v.

VIII. *Gelatin plate*, thirty-six hours at 22°. Superficial colony. Compare also Plate 14, VIII; Plate 19, III.

IX. *Gelatin plate*, four days at 22°. Superficial colony. Compare also Plate 19, IV, VII.

PLATE 17.

Bacterium typhi. Eberth. Gaffky. (Typhoid Bacillus.)

I. *Gelatin plate*, eight days at 22°. $\times 90$. Superficial colony. Compare also Plate 19, VI, VII.

II. *Gelatin plate*, eight days at 22°. $\times 150$. Superficial colony.

III. *Gelatin plate*, four days at 22°. Natural size.

IV. *Agar plate*, four days at 22°. Natural size.

V. *Agar plate*, four days at 22°. $\times 60$. Deep colonies.

VI. *Agar plate*, four days at 20°. $\times 60$. Superficial colony.

VII. *Potato culture*, five days at 22°.

VIII. *Microscopic preparation*. Pure culture from agar plate. $\times 1000$.

IX. *Microscopic preparation*. Bacilli with flagella. Copied after Fränkel and Pfeiffer. "Atlas der Bakterienkunde," Plate 54, III.

X. *Microscopic preparation*. Long threads thickly beset with flagella. $\times 1500$. Stained by Löffler's method.

XI. *Microscopic preparation of Bacterium typhi murium* Löffler, with flagella and capsule. $\times 1500$. Stained by Löffler's method.

X.

XI.

PLATE 18.

Bacterium coli (Escherich). L. and N.

I. *Gelatin stab culture*, ten days at 22°.

II. *Gelatin streak culture*, four days at 22°. In nature is transparent, resembling mother-of-pearl in iridescence. Compare also Plate 16, vi.

III. *Agar streak culture*, four days at 22°. Compare also Plate 16, v.

IV. *Agar stab culture*, two days at 22°. Stab canal.

V. *Agar stab culture*, two days at 22°. Surface growth.

VI. *Agar plate*, four days at 22°. $\times 60$. Deep colonies. Compare also Plate 14, vi.

VII. *Agar plate*, four days at 22°. $\times 60$. Part of a superficial colony. May also occasionally present forms like the bacillus acidi lactici. Compare Plate 12, iv; Plate 14, vi; Plate 17, vi.

VIII. *Agar plate*, three days at 22°. Natural size.

IX. *Potato culture*, five days at 22°. May also be paler or more deeply colored.

X. *Bacteria with long flagella of Bacterium brassicae acidæ*. $\times 1000$. Stained according to Löffler.

XI. *Bacterium of pigeon diphtheria surrounded by flagella*. $\times 1000$. Stained according to Löffler.

XII. *Bacteria with one flagellum, rarely two flagella, of Bact. coli β unipolaris*. $\times 1000$. Stained according to Löffler.

PLATE 19.

Bacterium coli (Escherich). L. and N.

I. *Gelatin plate*, eight days at 22°. × 60. Cultivated from pus. Deep colonies of abnormal form.

II. *Gelatin plate*, four days at 22°. Natural size.

III. *Gelatin plate*, one day at 22°. × 90. Superficial colony. Compare also Plate 14, VIII; Plate 16, VIII.

IV. *Gelatin plate*, four days at 22°. × 60. Superficial colony. Compare also Plate 16, IX; Plate 17, I, II.

V. *Gelatin plate*, four days at 22°. × 60. Deep colonies.

VI. *Gelatin plate*, ten days at 22°. × 90. Superficial colony.

VII. *Gelatin plate*, ten days at 22°. × 90. Superficial colony.

VIII. *Microscopic preparation*. Pure culture from agar plate. × 500.

IX. *Different varieties of coli bacteria*. × 1000. Variable sizes.

IX.

PLATE 20.

Bacterium latericum. Adametz.

- I. *Agar streak culture*, seven days at 22°.
- II. *Gelatin stab culture*, fourteen days at 22°.
- III. *Gelatin plate*, seven days at 22°. $\times 60$. To the right deep, to the left superficial colonies.
- IV. *Potato culture*, thirty days at 22°. Natural size.
- V. *Agar plate*, seven days at 22°. $\times 60$. To the right a superficial, to the left a deep colony.
- VI. *Microscopic preparation*. Pure culture on agar, twenty-four hours old. $\times$ about 800.

Bacterium hæmorrhagicum (Kolb). L. and N.

(Morbus Werlhofii.)

- VII. *Microscopic preparation*. Pure culture from bouillon, three days old. (Copied after Kolb, A. G., Bd. VII, Plate II, Figs. 1 and 2.)
- VIII. *Smear preparation from the liver of a dog*. (Copied after Kolb, l. c., Bd. VII, Plate III, Fig. 8.)

Bacterium prodigiosum (Ehrenb.). Lehm. and Neum.

- I. *Gelatin stab culture*, one day at 22°.
- II. *Agar streak culture*, four days at 22°.
- III. *Agar stab culture*, four days at 22°. Stab canal.
- IV. *Agar stab culture*, four days at 22°. Surface growth.
- V. *Agar plate*, from two to four days at 22°. Natural size. Colonies with and without color.
- VI. *Agar plate*, eight days at 22°. $\times 60$. Superficial colony reddish, deep one yellowish.
- VII. *Gelatin plate*, two days at 22°. $\times 60$. Superficial colony just beginning to sink in.
- VIII. *Gelatin plate*, two days at 22°. Natural size.
- IX. *Potato culture*, eight days at 22°. Typical with metallic luster on the surface.
- X. *Potato culture*, eight days at 22°. Atypical white growth.
- XI. *Microscopic preparation*. Pure culture from agar. $\times 800$. Stained with fuchsin.
- XII. *Bacteria with several flagella*. $\times 1000$. Stained according to Löffler.

XII.

PLATE 22.

Bacterium kiliense (Breunig and Fischer). L. and N.
(Kiel Water Bacillus.)

I. *Agar streak culture*, four days at 22°.

II. *Gelatin stab culture*, four days at 22°. No formation of pigment.

III. *Gelatin plate*, five days at 22°. Natural size. Colonies with and without production of pigment.

IV. *Gelatin plate*, five days at 22°. $\times 60$. Superficial colony.

V. *Gelatin plate*, five days at 22°. $\times 60$. Deep colony.

VI. *Agar plate*, five days at 22°. Natural size. Colored and uncolored, superficial and deep colonies.

VII. *Agar plate*, five days at 22°. $\times 60$. Colorless colonies. To the right, superficial; to the left, deep.

VIII. *Agar plate*, five days at 22°. $\times 60$. Colored colonies. To the right, superficial; to the left, deep.

IX. *Microscopic preparation*. Pure culture from agar plate. $\times 1000$. Stained with fuchsin.

X. *Potato culture*, five days at 22°.

PLATE 23.

Bacterium violaceum (J. Schröter). Lehm. and Neum.

I. *Gelatin stab culture*, ten days at ordinary temperature.

II. *Agar streak culture*, six days at ordinary temperature. The white borders after a longer time become likewise violet.

III. *Agar stab culture*, seven days at ordinary temperature. Stab canal.

IV. *Agar stab culture*, seven days at ordinary temperature. Surface growth.

V. *Agar plate culture*, four days at ordinary temperature. $\times 60$. Superficial and deep colonies. Within the former is to be seen the original deeply located colony.

VI. *Agar plate culture*, eight days at ordinary temperature. Natural size. The colonies often also become dark violet.

VII. *Gelatin plate culture*. Natural size. Six days at ordinary temperature. The blue zones are not always so intensely colored.

VIII. *Gelatin plate culture*, six days at ordinary temperature. $\times 60$. The smaller colony lies near the surface, the larger is on the surface.

IX. *Microscopic preparation*. $\times 700$. From a five-days'-old agar culture.

X. *Potato culture*, six days at ordinary temperature.

XI. *Bacteria with flagella*. $\times 1000$. Stained according to Löffler.

XII. *Bacteria with flagella*. $\times 1000$. From a culture from Sweden.

Bacterium fluorescens. Lehm. and Neum. (*Bacillus fluorescens liquefaciens*. Flügge.)

I. *Gelatin stab culture*, two days at 22°.

II. *Gelatin stab culture*, eight days at 22°.

III. *Agar streak culture*, three days at 22°.

IV. *Agar stab culture*, four days at 22°.

V. *Gelatin plate*, two days at 22°. $\times 90$. Part of a superficial colony.

VI. *Agar plate*, twenty-four hours at 22°. $\times 60$. (e) Superficial, (i) deep colonies.

VII. *Gelatin plate*, three days at 22°. Natural size.

VIII. *Microscopic preparation*. Pure culture from agar plate. $\times 800$.

IX. *Potato culture*, four days at 22°. Natural size. Compare also Plate 18, ix; Plate 26, v.

X. *Bacteria with flagella*, usually one, more rarely two or more. $\times 1000$. Stained according to Löffler.

X.

PLATE 26.

Bacterium putidum (Flügge). Lehm. and Neum. *Bacterium fluorescens putidum* Flügge. (*Bacterium fluorescens non-liquefaciens* Autor.)

I. *Gelatin stab culture*, three days at 22°.

II. *Gelatin plate*, twenty-four hours at 22°. × 90. Superficial colony. Compare Plate 14, VIII; Plate 19, III.

III. *Gelatin plate*, twenty-four hours at 22°. × 90. Deep colony.

IV. *Gelatin plate*, four days at 22°. Natural size. Appearance of colonies upon a dark background.

V. *Potato culture*, four days at 22°. Natural size. Compare also Plate 18, IX.

VI. *Microscopic preparation*. Pure culture from gelatin plate. × 800. Upon agar, threads are usually produced.

VII. *Agar plate*, eight days at 22°. Natural size. Appearance of the colonies upon a white background.

VIII. *Agar plate*, three days at 22°. × 60. (e) Superficial, (i) deep colonies.

IX. *Bacteria with one, more rarely two flagella*. × 1000. Stained according to Löffler.

Bacterium syncyaneum (Ehrenb.). Lehm. and Neum.
(*Bac. cyanogenes* Flügge; Blue Milk.)

I-III. *Gelatin stab cultures*, from six to ten days at 22°. There occur still other shades of color.

IV. *Agar stab culture*, ten days at 37°.

V. *Bouillon culture*, four days at 37°.

VI. *Milk culture*, three days at 37°. Inoculated upon unsterilized milk.

VII. *Microscopic preparation*. Pure culture from agar plate. $\times 800$.

VIII. *Microscopic preparation*. Pure culture. Flagella staining with Löffler's mordant. $\times 800$.

IX. *Bacteria with flagella*, one or more at one pole. $\times 1000$. Stained according to Löffler.

IX.

PLATE 28.

Bacterium syncyaneum (Ehrenb.). Lehm. and Neum.
(*Bac. cyanogenes* Flügge ; Blue Milk.)

I-III. *Potato cultures*, from three to ten days at 22°. Many varieties of potato inoculated with the same culture. The differences in colors may be still more numerous.

IV. *Agar plate*, three days at 22°. Natural size.

V. *Agar plate*, three days at 22°. $\times 60$. To the right, deep; to the left, superficial colonies.

VI. *Gelatin plate*, three days at 22°. Natural size.

VII. *Gelatin plate*, eight days at 22°. Natural size. Appearance of colonies upon a white background.

PLATE 29.

Bacterium Zopfii. Kurth.

- I. *Gelatin stab culture*, six days at 22°.
- II. *Agar streak culture*, thirty-six hours at 37°. It is actually a grayish color and transparent.
- III. *Agar stab culture*, six days at 22°. Stab.
- IV. *Agar stab culture*, six days at 22°. Surface growth.
- V. *Gelatin plate*, seven days at 22°. Natural size.
- VI. *Gelatin plate*, thirty-six hours at 22°. Natural size.
- VII. *Gelatin plate*, twenty-four hours at 22°. × 90. Thread-like portion of the deep colony.
- VIII. *Gelatin plate*, twenty-four hours at 22°. × 60. Superficial colony. Compare Plate 31, VII; Plate 32, VIII.

PLATE 30.

Bacterium Zopfii. Kurth.

I. *Gelatin plate*, eight days at 22°. $\times 90$. Peripheral portion of a colony.

II. *Microscopic preparation*. $\times 1000$. Pure culture, from agar plate, stained with fuchsin.

III. *Agar plate*, four days at 22°. Deep colony.

IV. *Agar plate*, twenty-four hours at 37°. Natural size.

V. *Agar plate*, twelve hours at 37°. Deep and superficial colony.

VI. *Agar plate*, twenty-four hours at 37°. $\times 60$. Superficial colony, surrounded by innumerable bacteria swarming outward.

VII. *Gelatin plate*, eight days at 22°. Sausage-shaped forms of the deep colony.

IX. *Bacteria with numerous flagella*. $\times 1000$. Stained according to Löffler.

Bacterium vulgare (Hauser). Lehm. and Neum. (*Proteus vulgaris* Hauser.)

- I. *Gelatin stab culture*, twenty-four hours at 22°.
- II. *Agar streak culture*, thirty-six hours at 22°.
- III. *Agar plate*, thirty-six hours at 22°. Natural size.
- IV. *Agar plate*, four days at 22°. $\times 60$. Above, superficial; below, deep colonies.
- V. *Gelatin plate*, thirty-six hours at 22°. Natural size.
- VI. *Gelatin plate*, thirty-six hours at 22°. $\times 60$. To the right, superficial; to the left, deep colonies. The lower, approaching the surface, begins to liquefy.
- VII. *Gelatin plate*, three days at 22°. $\times 60$. Deep colony. Zooglea form, similar to the Bact. Zopfii.
- VIII. *Microscopic preparation*. Pure culture upon agar. $\times 800$. Stained with fuchsin.
- IX. Bacteria with very numerous flagella. $\times 1000$.

IX.

PLATE 32.

Bacterium vulgare β mirabilis (Hauser). L. and N.
(*Proteus mirabilis* Hauser.)

I. *Agar stab culture*, two days at 22°. Stab canal.

II. *Agar stab culture*, two days at 22°. Surface growth.

III. *Gelatin stab culture*, six days at 22°.

IV. *Agar streak culture*, two days at 22°.

V. *Agar plate*, seven days at 22°. Natural size.

VI. *Agar plate*, seven days at 22°. $\times 60$. Above, superficial; below, deep colony.

VII. *Gelatin plate*, two days at 22°. $\times 60$. Deep colonies.

VIII. *Gelatin plate*, two days at 22°. $\times 60$. Superficial colony.

IX. *Potato culture*, eight days at 22°. Natural size.

- V. *Gelatin plate*, thirty-six hours at 22°. $\times 60$. Superficial colony.
- VI. *Agar plate*, four days at 22°. Natural size.
- VII. *Agar plate*, one day at 22°. $\times 60$. To the right, superficial; to the left, deep colonies.
- VIII. *Agar plate*, four days at 22°. $\times 60$. To the right, deep; to the left, superficial colonies.
- IX. *Potato culture*, five days at 22°. Natural size.
- X. *Microscopic preparation*. Pure culture on agar. $\times 800$.
- XI. *Bacilli with numerous flagella*. $\times 1000$. Stained according to Löffler.

XI.

PLATE 42.

Bacillus vulgatus. Migula. (*B. mesentericus vulgatus*
Flügge. Potato Bacillus.)

- I. *Gelatin stab culture*, ten days at 22°.
- II. *Agar streak culture*, ten days at 22°.
- III. *Agar stab culture*, six days at 22°. Surface growth.
- IV. *Agar plate*, six days at 22°. Natural size.
- V. *Agar plate*, six days at 22°. $\times 60$. Deep colonies.
- VI. *Agar plate*, six days at 22°. $\times 60$. Superficial colony.
- VII. *Gelatin plate*, eight days at 22°. Natural size.
- VIII. *Gelatin plate*, eight days at 22°. $\times 60$. Part of a superficial colony.
- IX. *Gelatin plate*, eight days at 22°. $\times 150$. Part of a superficial colony.
- X. *Potato culture*, five days at 22°. Natural size.
- XI. *Microscopic preparation*. Pure culture from agar, one day old. $\times 800$. Stained with fuchsin.
- XII. *Bacilli with numerous flagella*. $\times 1000$. Stained according to Löffler.

PLATE 43.

Bacillus mesentericus. Lehm. and Neum. (*B. mesentericus fuscus* Flügge.)

- I. *Gelatin stab culture*, two days at 22°.
- II. *Agar streak culture*, three days at 22°.
- III. *Potato culture*, one day at 22°. Natural size.
- IV. *Potato culture*, five days at 22°. Natural size.
- V. *Agar plate*, two days at 22°. Natural size.
- VI. *Agar stab culture*, four days at 22°. Surface growth.
- VII. *Agar plate*, two days at 22°. $\times 60$. Above, superficial; below, deep colonies.
- VIII. *Gelatin plate*, thirty-six hours at 22°. $\times 60$. Deep colonies.
- IX. *Gelatin plate*, thirty-six hours at 22°. $\times 60$. Superficial colony.
- X. *Gelatin plate*, two days at 22°. Natural size.
- XI. *Gelatin plate*, one day at 22°. $\times 60$. To the right, deep; to the left, superficial colonies.
- XII. *Microscopic preparation*. $\times 800$. From a pure culture on agar two days old. Stained with fuchsin. Some bacilli contain spores.
- XIII. *Bacilli with numerous flagella*. $\times 1000$. Stained by Löffler's method.

XIII.

PLATE 44.

Bacillus tetani. Nicolaier. (Tetanus Bacillus.)

I. *Sugar-agar stab culture*, three days at 37°.

II. *Sugar-gelatin stab culture*, six days at 22°.

III. *Sugar-gelatin plate*, four days at 22°. Grown without air.

IV. *Sugar-gelatin plate*, four days at 22°. $\times 60$. Natural size. Superficial and deep colonies. Grown without air.

V. *Sugar-agar plate*, four days at 37°. Natural size. Grown without air.

VI. *Sugar-agar plate*, four days at 37°. $\times 60$. Superficial and deep colonies. Grown without air.

VII. *Microscopic preparation*. Pure culture on sugar-agar, three days at 37°. $\times 1000$. Bacilli with spores. Double staining according to Ziehl.

VIII. *Microscopic preparation*. Pure culture on sugar-agar, two days at 37°. $\times 1000$. Some bacilli contain spores. Stained with fuchsin.

IX. *Microscopic preparation*. Pure culture on sugar-agar, twenty-four hours at 37°. $\times 1000$. Extremely long threads with faintly stained intervals.

X. *Microscopic preparation*. Pure culture on sugar-agar, six days at 37°. $\times 1000$. Stained with fuchsin. Long threads and chains of spores with faintly stained intervals.

XI. *Microscopic preparation*. Flagella staining. Highly magnified.

PLATE 45.

Bacillus Chauvœi. Macé. (Symptomatic Anthrax.)

- I. *Sugar-gelatin stab culture*, six days at 22°.
- II. *Sugar-agar stab culture*, three days at 37°.
- III. *Sugar-agar stab culture*, three weeks at 37°.
- IV. *Sugar-agar plate*, four days at 37°. Natural size.
Grown as anaerobe.
- V. *Sugar-agar plate*, four days at 37°. × 60. Superficial and deep colony. Grown as anaerobe.
- VI. *Sugar-gelatin plate*, four days at 22°. Natural size.
Grown as anaerobe.
- VII. *Sugar-gelatin plate*, four days at 22°. × 60.
Deep colony, grown as anaerobe.
- VIII. *Sugar-gelatin plate*, two days at 22°. × 150.
Part of a superficial colony. Grown as anaerobe.
- IX. *Microscopic preparation*. Pure culture on sugar-agar, three days at 37°. × 1000. Bacilli with spores and free spores. Stained with fuchsin.

PLATE 46.

Bacillus œdematis maligni. Koch. (Malignant Edema.)

I. *Sugar-agar stab culture*, eight days at 37°.

II. *Microscopic preparation.* Tuft of flagella. $\times$ about 1500. Copied from G. Novy ("Zeitschrift f. Hygiene," Bd. xvii, Taf. 1, 2).

III. *Microscopic preparation.* Bacilli with flagella. Pure culture on agar, twenty-four hours old. $\times$ 1000. Stained according to Löffler.

IV. *Sugar-agar plate*, four days at 22°. $\times$ 60. Part of a superficial colony.

V. *Sugar agar plate*, six days at 22°. Natural size.

VI. *Microscopic preparation.* Pure culture on agar, two days old at 37°. Bacilli with spores. $\times$ 1000. Stained with fuchsin.

VII. *Microscopic preparation.* Tissue-juice from guinea-pig. Smear preparation. Copied after Fränkel and Pfeiffer (Mikrophotogr. Atlas, Taf. xxiii, 46).

PLATE 47.

Vibrio cholerae. (Koch.) Buchner. (Comma Bacillus.)

- I. *Gelatin stab culture*, two days at 22°.
- II. *Gelatin stab culture*, seven days at 22°.
- III. *Gelatin stab culture*, eight days at 22°. Culture from a case of cholera asiatica in Hanover.
- IV. *Gelatin stab culture*, eight days at 22°.
- V. *Agar streak culture*, eleven days at 22°.
- VI. *Agar stab culture*, eight days at 22°. Stab canal.
- VII. *Agar stab culture*, eight days at 22°. Surface growth.
- VIII. *Agar plate*, six days at 22°. Natural size.
- IX. *Agar plate*, six days at 22°. Culture from a case of cholera asiatica in Hanover.

PLATE 48.

Vibrio cholerae. (Koch.) Buchner. (Comma Bacillus.)

I. *Agar plate*, thirty-six hours at 22°. × 60. To the left superficial, to the right deep colonies.

II. *Agar plate*, two days at 22°. × 60. To the left superficial, to the right deep colonies.

III. *Agar plate*, three days at 22°. × 60. To the left superficial, to the right deep colonies.

IV. *Agar plate*, three weeks at 22°. × 60. To the left superficial, to the right deep colonies.

V. *Agar plate*, five days at 22°. × 60. Colonies of a culture of cholera asiatica from Hanover. Superficial and deep colonies.

VI. *Gelatin plate*, four days at 22°. Natural size. Deeply sunken funnels of liquefaction.

VII. *Gelatin plate*, fourteen days at 22°. Natural size. Colony with a pronounced formation of zones.

VIII. *Gelatin plate*, four days at 22°. Shallow zones of liquefaction.

IX. *Gelatin plate*, six days at 22°. Superficial sinking in of colonies with concentric zones of liquefaction.

Vibrio cholerae. (Koch.) Buchner. (Comma Bacillus.)

I. *Gelatin plate*, thirty-six hours at 22°. × 60. Deep and superficial colonies.

II. *Gelatin plate*, forty-eight hours at 22°. × 60. To the left superficial, to the right deep colonies.

III. *Gelatin plate*, three days at 22°. × 60. Superficial colonies with zone of liquefaction.

IV. *Gelatin plate*, three days at 22°. × 60. Deep colonies.

V. *Gelatin plate*, four days at 22°. × 60. Superficial colony with zone of liquefaction.

VI. *Gelatin plate*, four days at 22°. × 60. Deep colony.

VII. *Gelatin plate*, five days at 22°. × 60. Deep colony from a culture of cholera from Hanover.

VIII. *Gelatin plate*, five days at 22°. × 60. Superficial colony. Complete liquefaction has already taken place.

IX. *Gelatin plate*, eight days at 22°. × 60. Superficial colony with zone of liquefaction.

PLATE 50.

Vibrio cholerae. (Koch.) Buchner. (Comma Bacillus.)

I. *Gelatin plate*, five days at 22°. × 60. Abnormal form of superficial colony.

II. *Gelatin plate*, five days at 22°. × 90. Abnormal form of superficial colony.

III. *Gelatin plate*, five days at 22°. × 60. Deeply sunken superficial colony with a strongly reflecting zone of liquefaction.

IV. *Gelatin plate*, six days at 22°. × 60. Abnormal superficial colony, with dense nucleus, evenly sunken in and with a zone of liquefaction.

V. *Gelatin plate*, six days at 22°. × 60. Abnormal deep colony, without halo, dark, with radiating striations, from the same plate as IV.

VI. *Potato culture*, two days at 22°. Natural size. Soaked in soda solution before inoculation.

VII. *Potato culture*, five days at 22°. Inoculated upon ordinary potato.

Vibrio danubicus Heider, **Vibrio berolinensis** Rubner,
Vibrio aquatilis Günther.

I. *Vibrio danubicus*: Gelatin stab culture, three days at 22°.

II. *Vibrio aquatilis*: Gelatin stab culture, three days at 22°.

III. *Vibrio danubicus*: Gelatin plate, three days at 22°. × 60. To the right superficial, to the left deep colony.

IV. *Vibrio danubicus*: Microscopic preparation. Pure culture on agar, twenty-four hours. Stained with fuchsin. × 800.

V. *Vibrio berolinensis*: Gelatin plate, three days at 22°. × 60. To the right superficial, to the left deep colony.

VI. *Vibrio berolinensis*: Microscopic preparation. Pure culture from agar, twenty-four hours. × 800. Stained with fuchsin.

VII. *Vibrio aquatilis*: Gelatin plate, three days at 22°. × 60. Deep colonies, swarming outward from one point forming secondary ones.

VIII. *Vibrio aquatilis*: Microscopic preparation. Pure culture on agar, twenty-four hours at 22°. × 800. Stained with fuchsin.

IX. *Vibrio aquatilis*: Gelatin plate, three days at 22°. × 60. To the right superficial, to the left deep colony.

PLATE 54.

Vibrio albensis. Lehm. and Neum. (Phosphorescent
Elbe Vibrio.)

I. *Gelatin stab culture*, twenty-four hours at 22°.

II. *Gelatin stab culture*, four days at 22°.

III. *Gelatin stab culture*, ten days at 22°.

IV. *Indol reaction* after ten days. Bouillon culture
with dilute sulphuric acid, warmed.

V. *Gelatin plate*, three days at 22°. × 60. Super-
ficial colony.

VI. *Gelatin plate*, three days at 22°. × 60. Deep
colonies.

VII. *Gelatin plate*, thirty-six hours at 22°. Natural
size.

Spirillum rubrum. Von Esmarch.

- I. *Agar stab culture*, ten days at 22°.
- II. *Agar streak culture*, twenty days at 22°.
- III. *Agar plate*, five days at 22°. × 60. (e) Superficial, (i) deep colonies.
- IV. *Gelatin plate*, seven days at 22°. × 60. (e) Superficial, (i) deep colonies.
- V. *Microscopic preparation*. Pure culture from bouillon, diluted ten times; two days at 37°. × 1000. Stained with fuchsin.
- V A. *Flagella preparation of spirillum rubrum*. × 1000. Stained according to Löffler.

V A.

Spirillum concentricum. Kitasato.

- VI. *Agar plate*, seven days at 22°. × 60. (e) Superficial, (i) deep colonies.
- VII. *Gelatin plate*, three days at 22°. × 60. (e) Superficial, (i) deep colonies.
- VIII. *Agar plate*, seven days at 22°. Natural size.
- IX. *Microscopic preparation*. Pure culture in bouillon, two days at 37°. × 1000. Stained with fuchsin.

PLATE 56.

Spirilla.

I. **Spirillum serpens** Müller. With difficulty staining protoplasmic border. $\times$ about 1000. Stained with fuchsin. Copied after Zettnow (C. B. x, Taf. 5).

II. **Spirilla from Nasal Mucus.** Smear preparation with two cells. $\times$ about 1000. Copied after Weibel (C. B. II, p. 468, Fig. 1).

III. **Spirilla from Nasal Mucus.** Agar plate. Pure culture. $\times$ about 1000. (Copied C. B. II, p. 468, Fig. 2.)

IV. **Spirilla from Nasal Mucus.** Gelatin plate. Pure culture. $\times$ about 1000. (Copied C. B. II, p. 468, Fig. 3.)

V. **Spirillum undula** Müller. With flagella. $\times$ about 800. Copied after Löffler (C. B. VI, Taf. I, Fig. 2).

VI. **Vibrio spermatozoides** Löffler. $\times$ about 1000. Copied after Löffler (C. B. VII, Taf. III, Fig. 7).

VII. **Spirochæte from Mucus of the Mouth.** (Copied after Löffler: Bakterien, Taf. I, Fig. 4.)

VIII. **Spirochæte Obermeieri** Cohn. Smear preparation from human blood. (Copied after Fränkel and Pfeiffer, Atlas, No. 134.)

IX. *Spirilla of relapsing fever.* Human blood. Spirilla grouped in the form of a star. (Copied after M. J. Soudekewitsch: Annales de l'institut. Pasteur, Bd. v, 1891, p. 514, plate 14, Fig. 1.)

PLATE 57.

Corynebacterium mallei. (Löffler.) L. and N.
(Glanders.)

- I. *Gelatin stab culture*, six days at 22°.
- II. *Agar streak culture*, six days at 37°. The central whitish streak is not always so pronounced.
- III. *Agar stab culture*, three days at 37°. Stab canal.
- IV. *Agar stab culture*, three days at 37°. Surface growth.
- V. *Gelatin plate*, five days at 22°. Natural size.
- VI. *Microscopic preparation*. Pure culture. $\times 800$. Stained with fuchsin.
- VII. *Agar plate*, two days at 22°. $\times 60$. Upper, superficial; lower, deep colonies.
- VIII. *Gelatin plate*, four days at 22°. $\times 60$. Upper colony superficial, lower ones deep.
- IX. *Potato culture*, two days at 37°.
- X. *Potato culture*, twenty days at 37°.
- XI. *Single bacteria*. Highly magnified. In many places the stain is taken poorly or not at all.

XI.

- XII. *Glycerin-agar plate*. Microscopic preparation. $\times 1200$. Branching and formation of clubs.

XII.

PLATE 58.

Corynebacterium diphtheriæ. (Klebs, Löffler.) L. and N.

Corynebacterium pseudodiphtheriticum. (Hofmann-Wellenhof.) Lehm. and Neum.

Corynebacterium xerosis. (Kuschbert, Neisser.) Lehm. and Neum.

I. **Coryneb. diphtheriæ.** *Glycerin-agar streak culture*, three days at 37°. Luxuriant growth; culture moist.

II. **Coryneb. diphtheriæ.** *Glycerin-agar streak culture*, three days at 37°. Delicate growth.

III. **Coryneb. pseudodiphtherit.** *Glycerin-agar streak culture*, three days at 37°. Luxuriant growth, culture moist.

IV. **Coryneb. xerosis.** *Glycerin-agar streak culture*, three days at 37°. Delicate growth; growth dry and dull.

V. **Coryneb. pseudodiphtherit.** *Glycerin-agar stab culture.* Surface growth, ten days at 37°. The culture is reproduced on account of its atypical brown color.

VI. **Coryneb. diphtheriæ.** *Gelatin stab culture.* Surface growth, ten days at 22°. The color fluctuates from white to dirty yellowish.

VII. **Coryneb. diphtheriæ:**

Natural size.	{	(a) <i>Glycerin-agar plate.</i> Colonies upon the surface, three days at 37°. Luxuriant growth. The same culture as I.
		(b) <i>Glycerin-agar plate.</i> Colonies upon the surface, three days at 37°. Delicate growth. The same culture as II.

VIII a. **Coryneb. pseudodiphtherit.** *Glycerin-agar plate.* Colonies lying upon the surface, three days at 37°. Natural size. Luxuriant growth. Answers to culture III.

VIII b. **Coryneb. xerosis.** *Glycerin-agar plate.* Colonies lying upon the surface, three days at 37°. Natural size. Dry, dull growth. Answers to culture IV.

VIII c. **Coryneb. xerosis.** *Glycerin-agar plate.* Colonies lying upon the surface, three days at 37°. Natural size. Delicate growth. Sometimes it may be still more delicate.

IX. **Coryneb. diphtheriæ.** *Potato culture*, ten days at 22°. The growth is typical, like a delicate veil, which in many places leaves no trace on the potato.

X. **Coryneb. pseudodiphtherit.** *Potato culture*, ten days at 22°. The growth is sharply outlined, white to dirty yellowish.

PLATE 59.

Corynebacterium diphtheriæ. (Klebs, Löffler.)

L. and N.

Corynebacterium pseudodiphtheriticum. (Hofmann-Wellenhof.) Lehm. and Neum.

Corynebacterium xerosis. (Kuschbert, Neisser.)

Lehm. and Neum.

I. **Coryneb. diphtheriæ.** *Plate cultures* (Ascites-fluid-agar and glycerin-agar). $\times 60$. Superficial colonies, twenty-four hours at 37° . Cultures of different origin.

II. **Coryneb. diphtheriæ.** *Plate culture* (glycerin-agar). $\times 60$. Superficial colonies, forty-eight hours at 37° . The same culture as I, *g, h*.

III. **Coryneb. diphtheriæ.** *Plate culture* (ascites-fluid-agar). $\times 60$. Superficial colony, five days at 37° . The same culture as I, *c, e*, and Plate 58, II.

IV. **Coryneb. pseudodiphtherit.** *Plate culture* (glycerin-agar). $\times 60$. Superficial colonies, forty-eight hours at 37° . The same culture as Plate 58, III.

V. **Coryneb. xerosis.** *Plate culture* (glycerin-agar). $\times 60$. Superficial colony, forty-eight hours, at 37° . Dry, dull, and very opaque. The same culture as Plate 58, IV, VIII *b*.

VI. **Coryneb. diphtheriæ.** *Plate culture* (ascites-fluid-agar). $\times 60$. Superficial colonies, forty-eight hours at 37° . The same culture as I, *f, l*, and Plate 58, I, VII *a*.

VII. **Coryneb. diphtheriæ.** *Plate culture.* The same as VI, but ten days old.

VIII. **Coryneb. xerosis.** *Plate culture* (glycerin-agar). $\times 60$. Superficial colonies, forty-eight hours at 37° . The same culture as Plate 58, VIII *c*.

Corynebacterium diphtheriæ (Klebs, Löffler). L. and N.

Corynebacterium pseudodiphtheriticum. (Hofmann-Wellenhof.) Lehm. and Neum.

Corynebacterium xerosis (Kuschbert, Neisser). Lehm. and Neum.

I. **Coryneb. diphtheriæ.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin. Corresponds to Plate 58, II, VII b; and Plate 59, II.

II. **Coryneb. diphtheriæ.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin. Corresponds to Plate 58, I, VII a; and Plate 59, VI.

III. **Coryneb. diphtheriæ.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin.

IV. **Coryneb. diphtheriæ.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin.

V. **Coryneb. pseudodiphtherit.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin.

VI. **Coryneb. pseudodiphtherit.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin. Corresponds to Plate 58, III, VIII a; Plate 59, I, IV.

VII. **Coryneb. xerosis.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin. Corresponds to Plate 58, IV, VIII b; and Plate 59, V.

VIII. **Coryneb. xerosis.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin.

IX. **Coryneb. xerosis.** *Glycerin-agar*, forty-eight hours at 37°. $\times 1000$. Stained with fuchsin. Corresponds to Plate 58, VIII c.

X. **Coryneb. diphtheriæ.** *Bovine blood-serum*, solidified at 100°, eighteen hours at 35°. $\times 1000$. Staining of Neisser's granules. The polar staining is characteristic. Corresponds to figure 1.

XI. **Coryneb. pseudodiphtherit.** *Bovine blood-serum*, solidified at 100°, eighteen hours at 35°. $\times 1000$. Staining of Neisser's granules. These occur also in many varieties of pseudodiphtheria, but not with such regularity at both poles.

XII. **Coryneb. diphtheriæ.** *Glycerin-agar*, four days at 37°. $\times 1000$. Stained with fuchsin. True branching.

XIII. **Coryneb. diphtheriæ.** Single organisms, highly magnified, schematic.

PLATE 6r.

Mycobacterium tuberculosis (Koch). Lehm. and
Neum. (Tubercle Bacillus.)

I. *Glycerin-agar streak culture*, fourteen days at 37°.

II. *Glycerin-agar streak culture*, forty days at 37°.

III. *Potato culture*, forty days at 37°.

IV. *Colonies of tubercle bacilli from a blood-serum culture*. $\times 700$. (Copied after R. Koch, Aetiologie der Tuberkulose. Mitteilungen des Kaiserl. Gesundheitsamt, Bd. 2, Taf. ix, 44.)

V. *Culture, upon blood-serum*, from a piece of a freshly extirpated scrofulous gland. (Copied like the above, Bd. 2, Taf. ix, 44.)

VI. *Giant cell with radially arranged bacilli*. From a caseous bronchial gland in a case of miliary tuberculosis. (Copied like above, Bd. 2, Taf. ii, 9.)

VII. *Microscopic preparation*. Pure culture, stained according to Ziehl. $\times 1000$.

VIII. *Branching of tubercle bacilli*. (Copied after Hayo Bruns, C. B. xvii, No. 23.)

IX. *Microscopic preparation*. Sputum, stained according to Ziehl. $\times 1000$.

X. *Single bacteria*, highly magnified.

X.

PLATE 62.

Mycobacterium lepræ. (Arm. Hansen.) Lehm. and Neum.

I. *Giant cell from a leprous ulcer of the epiglottis.* × about 1000. Stained according to Rusell. (Copied from Seifert and Kahn, Atlas der Histopathologie der Nase, 1875, Taf. 38, Fig. 75 b.)

II. *Transverse section of a blood-vessel in a leprous testicle.* Bacilli in endothelium and in a white blood-corpuscle. Stained by Gram's method, Bismarck brown, eosin, oil of bergamot. × about 1000. (Copied as No. III, fig. v.)

III. *Ulnar nerve, longitudinal section,* stained like above. (Copied from Lie, pathologische Anatomie der Lepra; Archiv für Dermatologie und Syphilis, Bd. xxix, 1895, Taf. vi, Fig. vii.)

IV. *Smear preparation from nasal mucus.* Stained by method for tubercle bacillus. From a preparation of Dr. Dieudonné. × 1000.

Mycobacterium tuberculosis γ piscicola. L. and N.

V. *Streak culture* (glycerin-agar), one month old at 22°.

VI. *Plate culture* (glycerin-agar), ten days at 22°. Natural size. Superficial colonies.

VII. *Plate culture* (glycerin-agar), six days at 22°. × 60. Superficial colony. The dark shadows and bright lights represent the strong reflection of the cartilaginous colony.

VIII. *Potato culture,* fourteen days at 22°. Sometimes also more homogeneous upon the surface.

IX. *Microscopic preparation.* Stained by the method for the tubercle bacillus. × 1000.

PLATE 63.

Mycobacterium lacticola β perrugosum. L. and N.

I. *Streak culture* (glycerin-agar), two months old; three days at 37°, then at 22°. Much elevated and wrinkled.

II. *Plate culture* (glycerin-agar), six days at 37°. $\times$ 60. Superficial colony.

III. *Plate culture* (glycerin-agar), forty-eight hours at 37°. $\times$ 60. Superficial colony.

IV. *Plate culture* (glycerin-agar), three days at 37°. Natural size. Superficial colonies. Later the same were larger, more wrinkled, and reddish.

V. *Potato culture*, six days at 22°. Later the same became still more wrinkled.

VI. *Microscopic preparation*. Glycerin-agar: (a) Three days at 37°. $\times$ 1000. Stained with fuchsin. (b) Two months at 22°. $\times$ 1000. Stained with fuchsin.

VII. *Microscopic preparation*. Smear from the peritoneal fluid of a guinea-pig, inoculated with butter. $\times$ 1000. Stained with tubercle bacillus stain. (From a preparation of Dr. Dieudonné.)

Mycobacterium phlei. Lehm. and Neum.

VIII. *Streak culture* (glycerin-agar), eight days at 22°. The culture at first is pale orange; later, it becomes darker and wrinkled.

IX. *Plate culture* (glycerin-agar), three days at 22°. $\times$ 60. Superficial colony.

X. *Plate culture* (glycerin-agar), eight days at 22°. $\times$ 60. Superficial colony.

XI. *Plate culture* (glycerin-agar), eight days at 22°. Natural size. Superficial colonies.

XII. *Microscopic preparation*. Glycerin-agar: (a) Three days at 37°. $\times$ 1000. Stained with fuchsin. (b) Two months at 22°. $\times$ 1000. Stained with fuchsin.

PLATE 64.

***Mycobacterium lacticola* a *planum*. L. and N.**

I. *Streak culture* (ordinary agar), two months at 22°.

II. *Streak culture* (glycerin-agar), six days at 37°.

III. *Streak culture* (glycerin-agar), three months at 22°.

The culture at first is whitish; later, it becomes very intensely orange-red.

IV. *Streak culture* (gelatin), six days at 22°.

V. *Potato culture*, six days at 22°. Its appearance varies widely. Sometimes it is lighter, sometimes darker, sometimes moister, sometimes drier, sometimes smooth, sometimes wrinkled.

VI. *Plate culture* (gelatin), six days at 22°. $\times 60$. (a) Superficial colony, resembling the colon; (b) deep colony.

VII. *Plate culture* (gelatin), six days at 22°. Natural size.

VIII. *Plate culture* (glycerin-agar), three days at 37°. $\times 60$. Superficial colony.

IX. *Plate culture* (glycerin-agar), three days at 37°. Natural size.

X. *Microscopic preparation*. Glycerin-agar, three days. $\times 1000$. Stained with fuchsin. The size of the rods scarcely varies in very old cultures. There as here are found small and large, slender and thick rods.

SAUNDERS' MEDICAL HAND-ATLASES

**A SERIES OF BOOKS OFFERING
A SATISFACTORY SUBSTITUTE FOR ACTUAL CLINICAL WORK**

SPECIAL OFFER

AS it is impossible to realize the beauty and cheapness of these atlases without an opportunity to examine them, we make the following offer: Any one of these books will be sent to physicians, carriage prepaid, upon request. If you want the book, you have merely to remit the price; if not, return the book by mail.

A Descriptive Catalogue of all our Publications Sent on Request

W. B. SAUNDERS COMPANY
925 Walnut Street Philadelphia

LONDON : 9, Henrietta Street, Covent Garden

SAUNDERS' MEDICAL HAND-ATLASES

IN planning this series of books arrangements were made with representative publishers in the chief medical centers of the world for the publication of translations of the atlases in thirteen different languages, the lithographic plates for all being made in Germany, where work of this kind has been brought to

Moderate Price

the greatest perfection. The enormous expense of making the plates being shared by the various publishers, the cost to each one was reduced approximately to one-tenth.

Thus, by reason of their **universal translation** and reproduction, affording international distribution, the publishers have been enabled to secure for these atlases the **best artistic and professional talent**, to produce them in the **most elegant style**, and yet to offer them at a **price heretofore unapproached in cheapness**.

Substitute for Clinical Observation

One of the most valuable features of these atlases is that they offer a **ready and satisfactory substitute for clinical observation**. Such observation, of course, is available only to the residents in large medical centers ;

and even then the requisite variety is seen only after long years of routine hospital work. To those unable to attend important clinics these books will be absolutely indispensable, as presenting in a complete and convenient form the most accurate reproductions of clinical work, interpreted by the most competent of clinical teachers.

Adopted by U. S. Army

As an indication of the great practical value of the atlases and of the immense favor with which they have been received, it should be

noted that the **Medical Department of the U. S. Army** has adopted the "Atlas of Operative Surgery" as its standard, and has ordered the book in large quantities for distribution to the various regiments and army posts.

Preiswerk and Warren's Dentistry

Atlas and Epitome of Dentistry. By PROF. GUSTAV PREISWERK, of Basil. Edited, with additions, by GEORGE W. WARREN, M. D., Professor of Operative Dentistry at the Pennsylvania College of Dental Surgery. With 44 lithographic plates in colors, 152 text-cuts, 343 pages of text. Cloth, \$3.50 net.

JUST READY

Preiswerk's atlas will be found invaluable to the practicing dentist, for the numerous excellent lithographs make very easy of comprehension those procedures that would be but imperfectly understood from description alone. The text, nevertheless, is unusually complete, and the translation into English has been done with great fidelity and smoothness. The editor, Dr. George W. Warren, has added much new matter.

Hecker, Trumpp, and Abt on Children

Atlas and Epitome of Diseases of Children. By DRS. R. HECKER and J. TRUMPP, of Munich. Edited, with additions, by ISAAC ABT, M. D., Assistant Professor of Diseases of Children, Rush Medical College. With 48 lithographic plates in colors, 144 text-cuts, and 485 pages of text.

READY SOON

It is a recognized fact that the Germans lead the world in the treatment of children's diseases, and this magnificent atlas fully maintains this reputation. The lithographic plates are wonderfully accurate, and the accompanying text is particularly full on treatment. Dr. Isaac Abt, the editor, has greatly improved the work by the addition of all the latest methods of treatment and diagnosis.

Each volume contains from 50 to 100 colored plates

Zuckerkandl and DaCosta's Operative Surgery

Second Edition, Revised and Greatly Enlarged

Atlas and Epitome of Operative Surgery. By DR. O. ZUCKERKANDL, of Vienna. Edited, with additions, by J. CHALMERS DACOSTA, M. D., Professor of the Principles of Surgery and Clinical Surgery, Jefferson Medical College, Philadelphia. With 40 colored plates, 278 text-cuts, and 410 pages of text. Cloth, \$3.50 net.

ADOPTED BY THE U. S. ARMY

In this new edition the work has been brought precisely down to date. The revision has not been casual, but thorough and exhaustive, the entire text having been subjected to a careful scrutiny, and many improvements and additions made. A number of chapters have been practically rewritten, and of the newer operations, all those of special value have been described. The number of illustrations has also been materially increased. Sixteen valuable lithographic plates in colors and sixty-one text-figures have been added, thus greatly enhancing the value of the work. There is no doubt that the volume in its new edition will still maintain its leading position as a substitute for clinical instruction.

OPINIONS OF THE MEDICAL PRESS

Philadelphia Medical Journal

"The names of Zuckerkandl and DaCosta, the fact that the book has been translated into 13 different languages, together with the knowledge that it is used in the United States Army and Navy, would be sufficient recommendation for most of us."

Munchener Medicinische Wochenschrift

"We know of no other work that combines such a wealth of beautiful illustrations with clearness and conciseness of language, that is so entirely abreast of the latest achievements, and so useful both for the beginner and for one who wishes to increase his knowledge of operative surgery."

Each volume is edited, with additions, by a leading specialist

Helferich and Bloodgood's Fractures and Dislocations

Atlas and Epitome of Traumatic Fractures and Dislocations. By PROFESSOR DR. H. HELFERICH, Professor of Surgery at the Royal University, Greifswald, Prussia. Edited, with additions, by JOSEPH C. BLOODGOOD, M. D., Associate in Surgery, Johns Hopkins University, Baltimore. *From the Fifth Revised and Enlarged German Edition.* With 216 colored illustrations on 64 lithographic plates, 190 text-cuts, and 353 pages of text. Cloth, \$3.00 net.

SHOWING DEFORMITY, X-RAY SHADOW, AND TREATMENT

This department of medicine being one in which, from lack of practical knowledge, much harm can be done, and in which in recent years great importance has obtained, a book, accurately portraying the anatomic relations of the fractured parts, together with the diagnosis and treatment of the condition, becomes an absolute necessity. This present work fully meets all requirements. As complete a view as possible of each case has been presented, thus equipping the physician for the manifold appearances that he will meet with in practice. The illustrations show the visible external deformity, the X-ray shadow, the anatomic preparation, and the method of treatment.

OPINIONS OF THE MEDICAL PRESS

Medical News, New York

"This compact and exceedingly attractive little volume will be most welcome to all who are interested in the practical application of anatomy. The author and editor have made a most successful effort to arrange the illustrations that the interpretation of what they are intended to present is exceedingly easy."

Brooklyn Medical Journal

"There are few books published that better answer the requirements for illustration than this work of Professor Helferich. . . . Such a collection of illustrations must be the result of much labor and thought."

They are Satisfactory Substitutes for Clinical Observation

Sultan and Coley's Abdominal Hernias

Atlas and Epitome of Abdominal Hernias. By PRIVAT-DOCENT DR. GEORG SULTAN, of Göttingen. Edited, with additions, by WILLIAM B. COLEY, M. D., Clinical Lecturer on Surgery, Columbia University (College of Physicians and Surgeons), New York. With 119 illustrations, 36 of them in colors, and 277 pages of text. Cloth, \$3.00 net.

DEALING WITH THE SURGICAL ASPECT

This new atlas covers one of the most important subjects in the entire domain of medical teaching, since these hernias are not only exceedingly common, but the frequent occurrence of strangulation demands extraordinarily quick and energetic surgical intervention. During the last decade the operative side of this subject has been steadily growing in importance, until now it is absolutely essential to have a book treating of its surgical aspect. This present atlas does this to an admirable degree. The illustrations are not only very numerous, but they excel, in the accuracy of the portrayal of the conditions represented, those of any other work upon abdominal hernias with which we are familiar. The work will be found a worthy exponent of our present knowledge of the subject of which it treats.

PERSONAL AND PRESS OPINIONS

Robert H. M. Dawbarn, M. D.,

Professor of Surgery and Surgical Anatomy, New York Polyclinic.

"I have spent several interested hours over it to-day, and shall willingly recommend it to my classes at the Polyclinic College and elsewhere."

Boston Medical and Surgical Journal

"For the general practitioner and the surgeon it will be a very useful book for reference. The book's value is increased by the editorial notes of Dr. Coley."

They have already appeared in thirteen different languages

Brühl, Politzer, and MacCuen Smith's Otology

Atlas and Epitome of Otology. By GUSTAV BRÜHL, M. D., of Berlin, with the collaboration of Professor DR. A. POLITZER, of Vienna. Edited, with additions, by S. MACCUEN SMITH, M. D., Professor of Otology in the Jefferson Medical College, Philadelphia. With 244 colored figures on 39 lithographic plates, 99 text-illustrations, and 292 pages of text. Cloth, \$3.00 net.

This excellent volume is the first attempt to supply in English an illustrated clinical handbook to act as a worthy substitute for personal instruction in a specialized clinic. This work is both didactic and clinical in its teaching, the latter aspect being especially adapted to the student's wants.

Clarence J. Blake, M. D.,

Professor of Otology, Harvard University Medical School, Boston.

"The most complete work of its kind as yet published, and one commending itself to both the student and teacher in the character and scope of its illustrations."

Grünwald and Newcomb's Mouth, Pharynx, Nose

Atlas and Epitome of Diseases of the Mouth, Pharynx, and Nose. By DR. L. GRÜNWALD, of Munich. Edited, with additions, by JAMES E. NEWCOMB, M. D., Instructor in Laryngology, Cornell University Medical School. With 200 illustrations on 42 colored lithographic plates, 41 text-cuts, and 219 pages of text. Cloth, \$3.00 net.

Journal of Ophthalmology, Otology, and Laryngology

"A collection of the most naturally colored lithographic plates that has been published in any book in the English language. . . . Very valuable alike to the student, the practitioner, and the specialist."

They are offered at a price heretofore unapproached in cheapness

Sobotta and Huber's Human Histology

Atlas and Epitome of Human Histology. By PR. DR. J. SOBOTTA, of Würzburg. Edited, with additions, by G. CARL HUBER, M. D., Professor of Histology and Embryology, University of Michigan, Ann Arbor. With 214 colored figures on 80 plates, 68 text-cuts, and 248 pages of text. Cloth, \$4.50 net.

This work combines an abundance of well chosen and most accurate illustrations with a concise text, and in such a manner as to make it both atlas and text-book. The colored lithographic plates have been produced with the aid of over thirty colors, and particular care was taken to avoid distortion and assure exactness of magnification.

Boston Medical and Surgical Journal

"In color and proportion they are characterized by gratifying accuracy and lithographic beauty. . . . May be highly recommended to those who are without access to histologic collections."

Haab and deSchweinitz's Operative Ophthalmology

Atlas and Epitome of Operative Ophthalmology. By DR. O. HAAB, of Zürich. Edited, with additions, by GEORGE E. DE SCHWEINITZ, M. D., Professor of Ophthalmology in the University of Pennsylvania. With 30 colored lithographic plates, 154 text-cuts, and 377 pages of text. Cloth, \$3.50 net.

RECENTLY ISSUED

This new volume forms an admirable conclusion of the series of atlases on the Eye prepared by Professor Haab. Operations are described with all the fidelity and clearness that thirty years' conscientious practice in eye work naturally brings. The colored illustrations exhibit the same perfection of art and accurateness of detail which are found only in this invaluable series of atlases.

Unsurpassed for accuracy, pictorial beauty, completeness, cheapness

Haab and deSchweinitz's Ophthalmoscopy

Atlas and Epitome of Ophthalmoscopy and Ophthalmoscopic Diagnosis. By DR. O. HAAB, of Zürich. *From the Third Revised and Enlarged German Edition.* Edited, with additions, by G. E. DESCHWEINITZ, M. D., Professor of Ophthalmology, University of Pennsylvania. With 152 colored lithographic illustrations; 85 pages of text. Cloth, \$3.00 net.

Not only is the student made acquainted with carefully prepared ophthalmoscopic drawings done into well-executed lithographs of the most important fundus changes, but, in many instances, plates of the microscopic lesions are added. It furnishes a manual of the greatest possible service.

The Lancet, London

"We recommend it as a work that should be in the ophthalmic wards or in the library of every hospital into which ophthalmic cases are received."

Haab and deSchweinitz's External Diseases of Eye

Atlas and Epitome of External Diseases of the Eye. By DR. O. HAAB, of Zürich. Edited, with additions, by G. E. DESCHWEINITZ, M. D., Professor of Ophthalmology, University of Pennsylvania. 98 colored illustrations on 48 lithographic plates and 232 pages of text. Cloth, \$3.00 net.

SECOND REVISED EDITION—RECENTLY ISSUED

In this thorough revision the text has been brought up to date by the addition of new matter, including references to some of the modern therapeutic agents. There have also been added eight chromolithographic plates.

The Medical Record, New York

"The work is excellently suited to the student of ophthalmology and to the practising physician. It cannot fail to attain a well-deserved popularity." (Review of previous ed.)

They are convenient in size and uniformly bound

Dürck and Hektoen's General Pathologic Histology

Atlas and Epitome of General Pathologic Histology.

By PR. DR. H. DÜRCK, of Munich. Edited, with additions, by LUDVIG HEKTOEN, M. D., Professor of Pathology, Rush Medical College, Chicago. 172 colored figures on 77 lithographic plates, 36 text-cuts, many in colors, and 453 pages of text. \$5.00 net.

JUST ISSUED

This new atlas gives the accepted views in regard to the significance of pathologic processes. All the illustrations have been made from original specimens without combining different microscopic fields. Extraordinary care has been taken to reproduce them as near perfection as possible, in many cases twenty-six colors being required.

Dürck and Hektoen's Special Pathologic Histology

Atlas and Epitome of Special Pathologic Histology.

By DR. H. DÜRCK, of Munich. Edited, with additions, by LUDVIG HEKTOEN, M. D., Professor of Pathology, Rush Medical College, Chicago. In Two Parts. Part I.—Circulatory, Respiratory, and Gastro-intestinal Tracts. Part II.—Liver, Urinary and Sexual Organs, Nervous System, Skin, Muscles, and Bones. 243 colored figures on 122 plates, and 350 pages of text. Per part: Cloth, \$3.00 net.

William H. Welch, M.D.,

Professor of Pathology, Johns Hopkins University, Baltimore.

"I consider Dürck's 'Atlas of Special Pathologic Histology,' edited by Hektoen, a very useful book for students and others. The plates are admirable."

They represent the best artistic and professional talent

Lehmann, Neumann, and Weaver's Bacteriology

Atlas and Epitome of Bacteriology: INCLUDING A TEXT-BOOK OF SPECIAL BACTERIOLOGIC DIAGNOSIS. By PROF. DR. K. B. LEHMANN and DR. R. O. NEUMANN, of Würzburg. *From the Second Revised and Enlarged German Edition.* Edited, with additions, by G. H. WEAVER, M. D., Assistant Professor of Pathology and Bacteriology, Rush Medical College, Chicago. In two parts. Part I.—632 colored figures on 69 lithographic plates. Part II.—511 pages of text, illustrated. Per part: Cloth, \$2.50 net.

INCLUDING SPECIAL BACTERIOLOGIC DIAGNOSIS

This work furnishes a survey of the properties of bacteria, together with the causes of disease, disposition, and immunity, reference being constantly made to an appendix of bacteriologic technic. The special part gives a complete description of the important varieties, the less important ones being mentioned when worthy of notice. The lithographic plates, as in all this series, are accurate representations of the conditions as actually seen, and this collection, if anything, is more handsome than any of its predecessors. As an aid in original investigation the work is invaluable.

OPINIONS OF THE MEDICAL PRESS

American Journal of the Medical Sciences

"Practically all the important organisms are represented, and in such a variety of forms and cultures that any other atlas would rarely be needed in the ordinary hospital laboratory."

The Lancet, London

"We have found the work a more trustworthy guide for the recognition of unfamiliar species than any with which we are acquainted."

There have been 82,000 copies imported since publication

Schäffer and Edgar's Labor and Operative Obstetrics

Atlas and Epitome of Labor and Operative Obstetrics.

By DR. O. SCHÄFFER, of Heidelberg. *From the Fifth Revised and Enlarged German Edition.* Edited, with additions, by J. CLIFTON EDGAR, M. D., Professor of Obstetrics and Clinical Midwifery, Cornell University Medical School. 14 lithographic plates in colors; 139 other cuts; 111 pages of text. \$2.00 net.

The book presents the act of parturition and the various obstetric operations in a series of easily understood illustrations. These are accompanied by a text that treats the subject from a practical standpoint.

Dublin Journal of Medical Science, Dublin

"One fault Professor Schäffer's Atlases possess. Their name, and the extent and number of the illustrations, are apt to lead one to suppose that they are merely 'atlases,' whereas the truth really is they are also concise and modern epitomes of obstetrics."

Schäffer & Edgar's Obstetric Diagnosis and Treatment

Atlas and Epitome of Obstetric Diagnosis and Treat-

ment. By DR. O. SCHÄFFER, of Heidelberg. *From the Second Revised German Edition.* Edited, with additions, by J. CLIFTON EDGAR, M. D., Professor of Obstetrics and Clinical Midwifery, Cornell University Medical School. 122 colored figures on 56 plates; 38 other cuts; 315 pages of text. \$3.00 net.

This book treats particularly of obstetric operations, and, besides the wealth of beautiful lithographic illustrations, contains an extensive text of great value. This text deals with the practical, clinical side of the subject.

New York Medical Journal

"The illustrations are admirably executed, as they are in all of these atlases, and the text can safely be commended, not only as elucidatory of the plates, but as expounding the scientific midwifery of to-day."

These are the famous "Lehmann medicinische Handatlanten"

Mracek and Stelwagon's Skin

Atlas and Epitome of Diseases of the Skin. By PROF. DR. FRANZ MRACEK, of Vienna. Edited, with additions, by HENRY W. STELWAGON, M. D., Professor of Dermatology in the Jefferson Medical College, Philadelphia. With 77 colored plates, 50 text-cuts, and 288 pages of text. Cloth, \$4.00 net.

JUST ISSUED—NEW (2d) EDITION

This volume, the outcome of years of scientific and artistic work, contains, together with colored plates of unusual beauty, numerous illustrations in black, and a text comprehending the entire field of dermatology. The illustrations are all original and prepared from actual cases in Mracek's clinic.

American Journal of the Medical Sciences

"The advantages which we see in this book and which recommend it to our minds are: First, its handiness; secondly, the plates, which are excellent as regards drawing, color, and the diagnostic points which they bring out. We most heartily recommend it."

Mracek and Bang's Syphilis and Venereal Diseases

Atlas and Epitome of Syphilis and the Venereal Diseases. By PROF. DR. FRANZ MRACEK, of Vienna. Edited, with additions, by L. BOLTON BANGS, M. D., late Prof. of Genito-Urinary Surgery, University and Bellevue Hospital Medical College, New York. With 71 colored plates and 122 pages of text. Cloth, \$3.50 net.

According to the unanimous opinion of numerous authorities, to whom the original illustrations of this book were presented, they surpass in beauty anything of the kind that has been produced in this field, not only in Germany, but throughout the literature of the world.

Robert L. Dickinson, M. D.,

Art Editor of "The American Text-Book of Obstetrics."

"The book that appeals instantly to me for the strikingly successful, valuable, and graphic character of its illustrations is the 'Atlas of Syphilis and the Venereal Diseases.' I know of nothing in this country that can compare with it."

The lithographs, all made in Germany, are unrivalled

Schäffer and Webster's Operative Gynecology

Atlas and Epitome of Operative Gynecology. By DR. O. SCHÄFFER, of Heidelberg. Edited, with additions, by J. CLARENCE WEBSTER, M. D. (EDIN.), F. R. C. P. E., Professor of Obstetrics and Gynecology in the Rush Medical College, in affiliation with the University of Chicago. With 42 lithographic plates in colors, many text-cuts, a number in colors, and 138 pages of text. Cloth, \$3.00 net.

RECENTLY ISSUED

The excellence of the lithographic plates and the many other illustrations in this atlas render it of the greatest value in obtaining a sound and practical knowledge of operative gynecology. Indeed, the artist, the author, and the lithographer have expended much patient endeavor in the preparation of the water-colors and drawings. They are based on hundreds of photographs taken from nature, and they reproduce faithfully and instructively the various situations. The text closely follows the illustrations, and is fully as accurate.

Shäffer and Norris' Gynecology

Atlas and Epitome of Gynecology. By DR. O. SHAFFER, of Heidelberg. *From the Second Revised and Enlarged German Edition.* Edited, with additions, by RICHARD C. NORRIS, A. M., M. D., Gynecologist to Methodist-Episcopal and Philadelphia Hospitals. With 207 colored figures on 90 plates, 65 text-cuts, and 308 pages of text. Cloth, \$3.50 net.

The value of this atlas will be found not only in the concise explanatory text, but especially in the illustrations. The large number of colored plates, reproducing the appearance of fresh specimens, will give the student a knowledge of the changes induced by disease that cannot be obtained from mere description.

Bulletin of Johns Hopkins Hospital, Baltimore

"The book contains much valuable material. Rarely have we seen such a valuable collection of gynecological plates."

These books are next best to actual clinical work

Jakob and Eshner's Internal Medicine & Diagnosis

Atlas and Epitome of Internal Medicine and Clinical Diagnosis. By DR. CHR. JAKOB, of Erlangen. Edited, with additions, by AUGUSTUS A. ESHNER, M. D., Professor of Clinical Medicine in the Philadelphia Polyclinic. With 182 colored figures on 68 plates, 64 illustrations in black and white, and 259 pages of text. Cloth, \$3.00 net.

In addition to an admirable atlas of clinical microscopy, this volume describes the physical signs of all internal diseases in an instructive manner by means of fifty colored schematic diagrams. As a means of instruction its value is very great; as a reference handbook it is admirable.

British Medical Journal

"Dr. Jakob's work deserves nothing but praise. The information is accurate and up to present-day requirements."

Grünwald and Grayson's Diseases of the Larynx

Atlas and Epitome of Diseases of the Larynx. By DR. L. GRÜNWARD, of Munich. Edited, with additions, by CHARLES P. GRAYSON, M. D., Clinical Professor of Laryngology and Rhinology, University of Pennsylvania. With 107 colored figures on 44 plates, 25 text-illustrations, and 103 pages of text. Cloth, \$2.50 net.

This atlas exemplifies a happy blending of the didactic and clinical, such as is not to be found in any other volume upon this subject. The author has given special attention to the clinical portion of the work, the sections on diagnosis and treatment being particularly full.

The Medical Record, New York

"This is a good work of reference, being both practical and concise. . . . It is a valuable addition to existing laryngeal text-books."

For "Special Offer" regarding these atlases see page 1

Hofmann and Peterson's Legal Medicine

Atlas of Legal Medicine. By DR. E. VON HOFMANN, of Vienna. Edited by FREDERICK PETERSON, M. D., Clinical Professor of Psychiatry, College of Physicians and Surgeons, N. Y. 120 colored figures on 56 plates, 193 text-cuts. \$3.50 net.

The Practitioner, London

"The illustrations appear to be the best that have ever been published in connection with this department of medicine, and they cannot fail to be useful alike to the medical jurist and to the student of forensic medicine."

Jakob and Fisher's Nervous System and its Diseases

Atlas and Epitome of the Nervous System and its Diseases. By PROF. DR. CHR. JAKOB, of Erlangen. *From the Second Revised German Edition.* Edited, with additions, by EDWARD D. FISHER, M. D., Professor of Diseases of the Nervous System, University and Bellevue Hospital Medical College, N. Y. 83 plates and copious text. Cloth, \$3.50 net.

Philadelphia Medical Journal

"We know of no one work of anything like equal size which covers this important and complicated field with the clearness and scientific fidelity of this hand-atlas."

Golebiewski and Bailey's Accident Diseases

Atlas and Epitome of Diseases Caused by Accidents. By DR. ED. GOLEBIEWSKI, of Berlin. Edited, with additions, by PEARCE BAILEY, M. D., Consulting Neurologist to St Luke's Hospital and Orthopedic Hospital, N. Y. 71 colored illustrations on 40 plates, 143 text-cuts, 549 pages of text. Cloth, \$4.00 net.

Medical Examiner and Practitioner

"It is a useful addition to life-insurance libraries, for lawyers, physicians, and for every one who is brought in contact with the treatment or consideration of accidents or diseases growing out of them, or legal complications flowing from them."

The "Atlas of Operative Surgery" has been adopted by U. S. Army

This book must be returned to
the Dental Library by the last
date stamped below. It may
be renewed if there is no
reservation for it.
